CHARACTERISTICS OF STUDENTS NEW TO THE TORONTO SCHOOL SYSTEM, 1981-1982

G. K. Tsuji
E. N. Wright

#166

September 1982

ACKNOWLEDGEMENTS

The authors would like to express their gratitude to:

- The Computer Services Department and in particular Sid Burney and Cheung Lui for preparing the data tapes;

- Ihor Prociuk of the University of Toronto Computing Services for performing the conversion of the original 1,600 BPI density tape to an 800 BPI density tape;

- Vita Vogl for patiently typing and re-typing the tables and text of this report.

INTRODUCTION

The analyses contained in this report represent the first attempt to utilize for research purposes, the student registration information collected by the Toronto Board of Education. Prior to this investigation, the data typically were accessed when information was required on a given child; the data had not been examined as representing a "population".

In 1980, the Board received a report concerning the collection of student demographic data. The Board recommended:

> "That, subject to approval of revised student information form by the Committee, selected data from a suitably revised student registration form, to include the information noted above, be incorporated into a central demographic profile of Toronto schools.
>
> (Minutes of Board, 1980, p. 108)

The kinds of information gathered from the student or an accompanying adult at the time of registration are similar to that collected for the Grade Nine Student Survey: Fall 1980 (Wright and Dhanota, 1981) and previous reports (Deosaran, Wright and Kane, 1976 and Wright, 1970). Eventually, it is expected that with the exception of race, the information required for the annual survey of grade nine students will be obtained from the registration process. This report, therefore, represents a first attempt at utilizing the registration data for survey-type analyses.

Also, because the registration data currently are not subjected to any rigorous editing procedures, the quality of the data collected from the registration process was not known. However, as the tables for this report were prepared and analyzed, certain difficulties concerning the completeness of the data came to light. Therefore, this report also draws some clear conclusions regarding the issue of data quality.

PROCEDURES

Every child who enters a Toronto Board of Education school completes or has completed for him/her, a registration form. (Samples of the Public School Registration Form and the Secondary School Registration Form used in 1981-1982 are included as Appendix A). The sole exception is the students entering grade nine from the separate school system.

A copy of these forms is sent to the Computer Services Department at the Education Centre for processing. The data are not edited systematically at any stage at the moment. Therefore, many inconsistencies, missing data, etc. are accepted and processed as received. To exacerbate matters a turn-around verification document to the schools to confirm or correct the data which was submitted has not yet been developed. The data tape as it was received from the Computer Services Department is what was utilized for this report.*

The computer work was done interactively on the Ontario Institute for Studies in Education's DEC-10 computer using the Statistical Package for the Social Sciences (SPSS).

*Actually, the tape received from the Computer Services Department had to be converted from its 1600 BPI (bits per inch) density to 800 BPI before it could be used on the Ontario Institute for Studies in Education's DEC-10 computer. However, the information on the tape was unchanged in the conversion process.

FINDINGS

The students discussed in this report represent all who are new to the Toronto school system. Essentially, there are two groups of new students, those who enter at the junior kindergarten level and those who enter at a higher grade. This distinction results in two fairly unique groups of students. If a student's first registration in a Toronto school is somewhere between senior kindergarten and grade 13, it is likely that the student attended school elsewhere, e.g. a grade three registrant probably attended grade two elsewhere. In other words, the SK-Gr. 13 group can be thought of as people new to Toronto. Conversely, children who register at the lowest grade level, junior kindergarten, are more likely to have been born in Toronto.

A series of tables describing some general characteristics of the new students is presented in this section. Their formats have been designed in such a way as to facilitate comparisons with comparable tables in previous Toronto student surveys (Wright and Dhanota, 1981; Deosaran, Wright and Kane, 1976 and Wright, 1970). Relatively, little text accompanies the tables; they are intended to be self-explanatory. Only findings which seem noteworthy are highlighted in the text. The tables as a group, follow the complete text.

Place of Birth

Table 1 provides a regional breakdown of the birthplaces of the two groups of new students. Almost 90% of the junior kindergarten pupils are Canadian-born; whereas only 41.5% of the older students are born in Canada. Clearly, a temporally-related phenomenon is in evidence here. A four-year old is more likely to be living in the place where she/he was born than a fourteen-year old.

Table 2 lists the individual countries of birth for both groups of students. The countries contributing the proportionately largest numbers of immigrants in this school year are Hong Kong, Vietnam and China.

Mother Tongue and Language Fluency

Table 3 shows that of those with available information, 51.4% of the junior kindergarten pupils and 42.2% of the SK-Gr 13 students learned only English as a mother tongue. French as a mother tongue was learned by only 0.6% of the junior kindergarten pupils and 1.9% of the SK-Gr 13 students. (No data is available for over 10% of either group; there is no way of determining how these students for whom data are missing would be distributed over the seven language categories.)

Table 4 lists mother tongues other than English and French. Students who reported both English and/or French and another language as a mother tongue are included because it was felt that the learning of the "other" language would constitute a significant cultural influence. Table 4 reveals that Chinese (17.6%) and Portuguese (15.4%) for the junior kindergarten pupils

and Chinese (18.5%), Cantonese (16.3%) and Vietnamese (10.3%) for the older students are the most frequently reported mother tongues other than English and French. For both groups, proportionately large numbers of students provided no information.

Table 5 lists all of the languages in which students reported being fluent. As expected, it matches fairly closely, the mother tongue pattern exhibited in Tables 3 and 4. There are again, large numbers of students for whom no information was available.

Family Status

Table 6 shows that 70.3% of the junior kindergarten pupils and 41.2% of the older students are from two-parent households. The next largest group for which data are available is the single mother category, 13.3% and 17.2%, respectively. Again, a temporally-related phenomenon is in evidence here, namely, that the parents of the older students have had more time to separate and/or divorce since the birth of that child. Over a quarter of the SK-Gr. 13 students had no data available for this item.

Socio-Economic Status

The Blishen occupational scales for males and females (Blishen and Carroll, 1978 and Blishen and McRoberts, 1976) are used in this resport. Using 1971 Canadian census data, their scales for males and females rank the various occupations according to a combination of income and education and its associated prestige.

The occupational groupings as obtained from the natural clusterings of the 1981 grade nine student survey data (Wright and

Dhanota, 1981) are used here. (See Appendices B(1) and B(2) for illustrative occupations.)

Table 7 presents the distribution of the data for the fathers' occupations for those families where both parents are present. The junior kindergarten pupils' fathers are more highly concentrated in SES (Socio-Economic Status) Category 2 (23.0%) and least so in the non-remunerative SES Category 1 (3.4%). The fathers of the SK-Gr 13 students are also more concentrated in the second SES group. Both groups suffer from missing information; 26.3% and 42.7%, respectively. (Missing data, particularly when it reaches these proportion, can distort the picture considerably and is a matter of serious concern.)

As shown in Table 8, the majority of the mothers in two-parent households are in the non-remunerative SES Category 1; 44.8% and 30.2% for the two groups of students, respectively. The difference may be a reflection of the desire on the part of the mothers to stay home and care for their young children. Here again, there is considerable missing information.

Forty-eight junior kindergarten pupils live with their fathers only. See Table 9. Apart from almost a third of the respondents providing no occupational information, the rest of the fathers are distributed fairly evenly over SES Categories 2 through 5; few are in the non-remunerative SES Category 1. Among the SK-Gr 13 groups, no information is available for 41.6% of the fathers. The rest are distributed relatively evenly over the six SES Categories.

Table 10 shows that of the 473 junior kindergarten pupils who lived with their mothers only, 39.5% are classified in SES

Category 1. The SK-Gr 13 group also finds its highest concentration in SES Category 1. Both suffer from proportionately large amounts of missing information.

DISCUSSION

This report describes some general characteristics of the students, new to the Toronto school system. It does so along two dimensions, horizontally along the junior kindergarten axis and vertically from senior kindergarten to Grade 13.

While the majority (88.1%) of the junior kindergarten pupils are native-born, only 41.5% of the SK-Gr. 13 students are. However, with regards to language, only 58.9% of the junior kindergarten pupils and 46.7% of the SK-Gr 13 students learned English either alone or with another language as a mother tongue. There are 0.6% of the junior kindergarten pupils and 1.9% of the SK-Gr 13 students who learned French as a mother tongue. Of the students who learned a language other than English or French as a mother tongue, Chinese and Portuguese were reported most often for both groups with the addition of Cantonese for the SK-Gr 13 group. A similar pattern is exhibited by the fluency data.

Over seventy percent of the junior kindergarten pupils come from two-parent families. Over forty percent of the SK-Gr 13 students reside with both parents; 17.2% live with their mothers only.

With regard to socio-economic status, at least 20% of any group of junior kindergarten and at least 40% of the SK-Gr 13 students did not have information available.

Apart from the analyses of the new-student population, the utility of the student registration information master file as a data base for survey-type investigations has been demonstrated. However, the large amounts of missing information are obvious

causes for concern, particularly in the language, family structure and occupational areas. A number of measures to improve the situation are possible; one, asking the persons responsible for having the registration forms completed in the schools to attempt to obtain more complete information; two, implementation of a turn-around document to the schools for completion and verification purposes; three monitoring more closely, the coding of the forms; and four subjecting the data input to computerized edit checks before they are added to the student registration master file.
